SYNTHESIS AND ANALGESIC POTENTIAL OF SOME SUBSTITUTED PYRROLIDINES

M.N. ABOUL-ENEIN S.EL-DIFRAWY N.A. ABDALLAH N.M. KHALIFA M.Y. EBEID W. WERNER

SUMMARY: A series of 3-aroyloxy-1-methyl-5-phenyl pyrrolidines (<u>5a-k</u>) was prepared and screened for their analgesic potency as well as their local anaesthetic activity. Key Words: Pyrrolidines, esters of 1-methyl-5-phenyl-3-pyrrolidinol analgesics, local anaesthetics.

INTRODUCTION

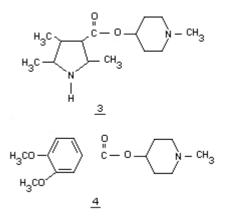

It has been reported that various substituted pyrrolidines display versatile pharmacological profiles, such as anticholinergics by Adamson *et al.* (1) and CNS stimulants by Seeger and Kottler (2), as antihistaminics by Weidmann *et al.* (3), Ondelli *et al.* (4), and atihypertensives by Rubin *et al.* (5). Also, among these profiles is the analgesic activity which has been disclosed by Keats *et al.* (6) in dextromoramide <u>1</u> and by Bowman *et al.* (7) in compound <u>2</u>, which are more potent than morphine.

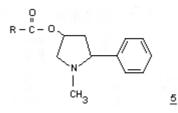

Laboratory of Pharmaceutical Science, National Research Centre, Dokki, Cairo, Egypt; Faculty of Pharmacy, Cairo University; Institut für Pharmazeutische Chemie der Westfalischen Wilhems Universitat of, Munster, West Germany.

Journal of Islamic Academy of Sciences 3:3, 180-184, 1990

On the other hand, Waters (8-10) reported that simple aromatic and heteroaromatic esters of non-quaternary carbon-4 piperirinols $\underline{3}$ and $\underline{4}$ exhibit potent antinociceptive potential comparable to that of morphine without featuring physical dependence liability.

The present work describes the synthesis of some esters 5, of the novel 5-methyl-5-phenyl-3-pyrrolidinol 6, aiming to achieve compounds having antinociceptive properties.

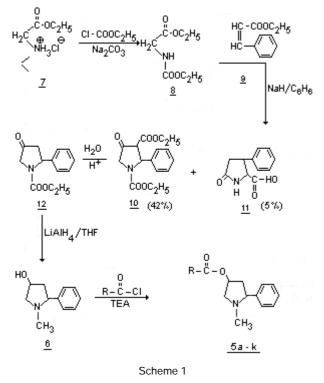

180

Moreover, the prepared compounds exhibit the structural features of the local anaesthetics basic esters having the general skeleton:

Therefore, the biological investigation is extended to involve the local anaesthetics activity.

The synthetic strategy of the target compounds is illustrated in scheme 1 (vide infra).

MATERIALS AND METHODS

Melting points were determined on Büchi 510 melting point apparatus and are uncorrected. Infrared spectra were recorded on Beckmann Infracord, model 4220. The microanalytical data were obtained from the National Research Centre, Dokki, Cairo. The analytical results deviated maximally \pm 0.4% from the theoretical values for C, H and N. The ¹H-NMR (CDCl₃, TMS) were recorded on VARIAN (90 MHz ¹H). The mass spectrum was obtained on VARIAN CH-5 and CH-7 spectrometers. The mass spectrum was performed at the Institut für Pharmazeutische Chemie, Universitat Munster, FRG. Purification of the products were performed by using column chromatography using neutral aluminia activity I as an adsorbent and n-hexane / CH₂/Cl₂ (1:1) as the eluent. Compounds <u>7</u> and <u>8</u> were prepared as previously described by Marver, Brenner *et al.* and Mair *et al.* (11-13) respectively.

Diethyl 4-oxo-2-phenyl-1, 3-pyrrolidine dicarboxylate 10.

To a stirred suspension of 2.4 g (0.1 mol) of sodium hydride in 100 ml of dry benzene, 17.5 g (0.1 mol) of the diester 8 was added dropwisely. After the addition of one-quarter of 8, the mixture was gently heated, to initiate the reaction. The rest of the diester 8 was added at such a rate to maintain gentle reflux throughout the addition. The reaction mixture was stirred overnight at room temperature, then 17.6 g (0.1 mol) of ethyl cinnamate 9 was added dropwisely and stirred for additional 30 min. The reaction mixture was refluxed for 2 h, then treated with 2 ml of absolute ethanol and refluxed for further 18 h. After cooling, the whole was poured over 300 ml of ice-water. The benzene layer was separated, and washed with water (2X50 ml). The combined aqueous layers were shaken with ether (2x50 ml), then acidified to pH 3-4 with 10% H₂SO₄, extracted with ether (4x50 ml), dried (MgSO₄) and concentrated in vacuo where the cyclized product 10 (14-16) was crystallized from ether as white powder of 12.8 g (42%), mp 108-110°C.

IR (KBr, cm⁻¹): 3300 (OH), 1700, 1680 (C = O, esters) and 1640 (C= O of β -keto ester).

¹H-NMR (CDCl₃, TMS): δ (ppm)=0.9-1.36 (two t overlapping, 6H, two CH₃), 3.53-4.43 (broad m, 7H, two CH₂ and H in the 3-position), 5.53-5.71 (m, IH, H in the 2-position), 7.23 (s. 5H, aromatic protons).

The equeous acidic phase was concentrated to one-third of its volume, where the by product 3-phenyl-5-oxo-pyrrolidin-2-carboxylic acid $\underline{11}$ was precipitated as white crystals (5 %), mp 184-6°C.

IR(KBr, cm⁻¹): 3200-3220 (NH, OH), 1730 (C = O, carboxylic acid) and 1660 (C = O, amidic carbonyl group).

Ethyl 4-Oxo-2-phenyl-I-pyrrolidine carboxylate 12

A mixture of 30.5 g (0.1 mol of <u>10</u>, 90 ml water and 0.9 ml concentrated hydrochloric acid, was refluxed under stirring for 15 h. The resulting reaction mixture was saturated with NaCl and extracted with CH_2Cl_2 (3x10 ml), dried (MgSO₄) and evaporated in vacuo to give 23.3 g (100 %) of <u>12</u> as reddish brown oil which was purified by column chromatography to give 22 g (95 %) of 12 as viscous oil (15).

IR (liquid film, cm⁻¹): 1770 (C = O, five membered ring ketone) and 1700 (C = O ester).

¹H-NMR (CDCl₃, TMS): δ (ppm)=1.16-1.3 (t, 3H-NCOOCH₂CH₃) 2.56-3.4 (broad m, 2H, CH₂ in the 3-position), 4.0-4.4 (broad m, 4H, CH₂ in the 5-position and -NCOOCH₂CH₃), 5.56-5.73 (m, 1H, CH in the 2-position), 7.36-7.56 (m, 5H, aromatic protons).

The semicarbazone of 12, mp 196-8°C (17).

1-Methyl-5-phenyl-3-pyrrolidinol 6

A solution of 23.3 g (0.1 mol) of 6 in 60 ml of dry THF was

Journal of Islamic Academy of Sciences 3:3, 180-184, 1990

added dropwise to a stirred cold suspension of 7.6 g (0.2 mol) of LiAlH₄ in 120 ml of dry THF. The mixture was refluxed for 24 h, then cooled and the complex formed was decomposed with a saturated solution of Na₂SO₄. After filtration, the solvent was evaporated in vacuo to give a viscous oil, which was acidified under cooling with 5N HCI and washed with ether (2x25 ml). The equeous acidic layer was basified under cooling with 10 % NaOH, extracted with CH_2Cl_2 (3x30 ml), dried (MgSO₄) and evaporated in vacuo to give 15 g (85%) of <u>6</u> as dark brown oil, which was purified by column chromatography to give 14.5 g (82 %) as golden viscous oil. Analy (C₁₁H₁₅NO).

Pharmacology

Analgesic activity:

The test compounds <u>5a-k</u> were evaluated for their analgesic activity using the hot-plate technique as described by Janssen *et al.* (18). Morphine HCI was used as reference. The dose producing analgesic activity in 50% of mice (ED₅₀ and 95% confidence limits) was calculated by the graphical method of Litchfied and Wilcoxon (19).

Local anaesthetic activity:

The procedure of Jones and Weaver (20) was adopted, using the cornea of the male albino mice and procaine hydrochloride as a reference six mice were used to locate each point on the dose response curve which was calculated by the method of Litchfield and Wilcoxon (19).

RESULTS AND DISCUSSION

Analgesic activity

Compounds <u>5a-k</u> were evaluated for their analgesic activity (18) (Table 2). The most active compounds in this series are <u>5h</u> and <u>5k</u>. Both possess an analgesic effect about 6.4 % that of morphine hydrochloride.

With respect to the structure-activity relationship (SAR), the substitution in the aromatic moiety of 5 revealed the following potency order preference:

 $\begin{array}{c} \mathsf{CH}_{8} & \mathsf{C}_{8}\mathsf{H}_{5}\\ \mathsf{C}_{8}\mathsf{H}_{5}\cdot\mathsf{CH}_{2}\rightarrow\mathsf{4}\cdot\mathsf{i}\mathsf{C}_{4}\mathsf{H}_{9}\cdot\mathsf{C}_{8}\mathsf{H}_{4}\cdot\mathsf{CH}\rightarrow\mathsf{4}\cdot\mathsf{CI}\cdot\mathsf{C}_{8}\mathsf{H}_{4}\rightarrow\mathsf{C}_{8}\mathsf{H}_{5}\rightarrow\mathsf{C}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{C}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{C}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{C}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{CH}_{8}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{5}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{CH}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}\rightarrow\mathsf{H}_{6}$

C₈H₄→(C₈H₅)₂-CH-

Local anaesthetic activity

Using albino mice for local anaesthetic evaluation (20) (Table 2) it was found that compounds 5c and 5g exhibited stronger local anaesthetic potency than the reference drug procaine hydrochloride. Compounds 5c and 5g pos-
